

Module 12: Installation, Storage, and Compute with Windows Server

- 1. What two options are provided in the type of installation window during Windows Server 2016 installation?**
 - a. Server Core Installation
 - b. Server with Desktop Experience
- 2. Write the steps to configure a server step by step.**
 - i. Install Windows Server 2016
 - ii. Set administrator password
 - iii. Configure IP address and DNS
 - iv. Rename the server
 - v. Install required server roles and features
 - vi. Configure firewall and security settings
 - vii. Join domain or create a domain
 - viii. Update the server and restart
- 3. What are the Pre-installation tasks?**
 - a. Check hardware requirements
 - b. Backup important data
 - c. Prepare installation media
 - d. Verify network settings
 - e. Check disk partitions and storage space
 - f. Plan server roles and configurations
- 4. What are the Post-installation tasks?**
 - a. Install updates and drivers
 - b. Configure IP and DNS settings
 - c. Rename the server
 - d. Activate Windows Server
 - e. Configure security settings and firewall
 - f. Install server roles and features

Module 12: Installation, Storage, and Compute with Windows Server

5. What is the standard upgrade path for Windows Server?

- a. Windows Server 2012 → Windows Server 2016
- b. Windows Server 2016 → Windows Server 2019
- c. Windows Server 2019 → Windows Server 2022

6. What is the Physical structure of AD (Active Directory)?

- a. Domain Controllers
- b. Sites
- c. Networks and Subnets

7. What are the Logical components of Active Directory?

- a. Forest
- b. Trees
- c. Domains
- d. Organizational Units (OUs)

8. What is the full form of LDAP?

--- Lightweight Directory Access Protocol

9. What is the location of the AD database?

The Active Directory database file is stored at:
C:\Windows\NTDS\NTDS.dit

10. What is Child DC?

A Child Domain Controller is a domain controller that manages a child domain under a parent domain in Active Directory.

11. Explain the term Forest in AD.

A forest in Active Directory is the highest-level structure that contains one or more domain trees sharing a common schema, configuration, and global catalog. It provides security and trust relationships between domains.

12. What is Active Directory? Check all that apply.

- An open-source directory server
- A Windows-only implementation of a directory server
- Microsoft's implementation of a director ✓

Module 12: Installation, Storage, and Compute with Windows Server

- An LDAP-compatible directory server ✓
13. . When you create an Active Directory domain, what's the name of the default user account?
- Superuser
 - Root
 - Username
 - Administrator ✓
14. AD domain provides which of the following advantages? Check all that apply.
- Centralized authentication ✓
 - More detailed logging ✓
 - Centralized management with GPOs ✓
 - Better performance
15. What are the minimum hardware requirements for installing Windows Server 2016?
- Processor: 1.4 GHz 64-bit CPU
 - RAM: 512 MB (Server Core), 2 GB (Desktop Experience)
 - Storage: 32 GB minimum disk space
 - Network: Ethernet adapter (1 Gbps recommended)
 - Display: VGA or higher resolution monitor
16. Explain the different editions of Windows Server 2016 and their features.
- **Datacenter Edition:** Full features, unlimited virtualization, advanced datacenter capabilities
 - **Standard Edition:** Core features, limited virtualization (2 VMs per license)
 - **Essentials Edition:** For small businesses (up to 25 users/50 devices), simplified management
 - **Features include:** Active Directory, Hyper-V, DNS, DHCP, storage services, and security tools
17. Walk through the steps of installing Windows Server 2016 using GUI mode.
- Boot from installation media
 - Select language, time, and keyboard settings
 - Click “Install Now”
 - Choose **Server with Desktop Experience**

Module 12: Installation, Storage, and Compute with Windows Server

- Accept license agreement
- Select installation type (Custom)
- Choose disk partition
- Begin installation
- Set Administrator password
- Log in to GUI desktop

18. Explain the process of promoting a Windows Server to a domain controller.

- Boot from installation media
- Select language settings
- Click “Install Now”
- Choose **Server Core Installation**
- Select edition
- Choose disk and install
- Set Administrator password after reboot
- Configure using command line or PowerShell

19. **Discuss the steps involved in upgrading from a previous version of Windows Server to Windows Server 2016.**

- Open Network Settings after installation
- Go to Network Adapter Properties
- Set **Static IP address** (recommended for servers)
- Configure Subnet Mask, Default Gateway
- Set Preferred and Alternate DNS servers
- Apply and test connectivity using ping

20. What is Active Directory Domain Services (AD DS), and what are its key components?

- Install AD DS role
- Open Server Manager
- Click “Promote this server to a domain controller”
- Choose Add new forest or existing domain
- Set domain name
- Configure DSRM password
- Complete wizard and restart server

21. How do you create a new Active Directory user account in Windows Server ?

- Check system compatibility
- Backup data
- Insert installation media

Module 12: Installation, Storage, and Compute with Windows Server

- Run setup.exe
- Choose Upgrade option
- Select edition
- Follow installation wizard
- System restarts and completes upgrade
- Install updates

22. Explain the process of creating and managing Group Policy Objects (GPOs) in Windows Server 2016 or 2019.

ANS :Active Directory Domain Services (AD DS) is a directory service that stores and manages network objects.

Key components:

- Domains
- Domain Controllers
- Trees
- Forests
- Organizational Units (OUs)
- Objects (users, computers, groups)

23. What are Organizational Units (OUs) in Active Directory, and how do you use them?

- Open **Active Directory Users and Computers**
- Select domain or OU
- Right-click → New → User
- Enter user details
- Set username and password
- Configure password policies
- Click Finish

24. Describe the process of delegating administrative privileges in Active Directory.

Delegating Administrative Privileges in Active Directory (Short Answer)

Delegating administrative privileges in Active Directory means giving specific users or groups permission to manage certain objects or tasks without giving full domain admin rights.

Module 12: Installation, Storage, and Compute with Windows Server

Steps:

1. Open **Active Directory Users and Computers (ADUC)**
2. Right-click the required **Organizational Unit (OU)**
3. Select **Delegate Control**
4. Add the user or group
5. Choose the required tasks (e.g., reset password, manage users)
6. Finish the wizard

Result:

The selected user or group can perform only the assigned administrative tasks within that OU.
